

Alpha One Evidence Federation

OPERATING MANUAL · XAO-010 · VERSION 1.0

One identifier is not one truth.

The bridge imports canonical Xen OS evidence only when the identifier, semantic contract, certification level, release commit, workflow run, source commit and privacy boundary all pass.

Gate	Required proof
Source	Canonical xen-operating-system main at a full commit SHA
Contract	GOVERNED_WORKFLOW_EXECUTION_RUNTIME
Certification	Environment or stronger
Release	Full release commit plus successful workflow run
Privacy	No credentials, secrets or raw workflow logs

Current canonical finding

The certified XRI-006 receipt proves Xen Repository Intelligence Runtime Version 2.0 at repository level. Alpha One requires the Governed Workflow Execution Runtime at environment level. The bridge therefore returns IDENTIFIER_COLLISION_CONTRACT_MISMATCH and keeps XRI-006 current.

Operate and recover

1. Inspect

Open Alpha One Activation and read the Evidence Federation card.

2. Reconcile

Confirm source commit, contract, candidates, certification and collision count.

3. Correct canonically

Publish a contract-matching environment receipt in Xen OS.

4. Regenerate

Update the machine-readable federation receipt from canonical main.

5. Validate

Run federation, Activation Center, Guardian and site tests.

6. Retry

XRI-007 becomes current only after XRI-006 evidence is accepted.

Fail-closed guarantees

Malformed, weak, stale, privacy-unsafe or semantically mismatched evidence never advances the ordered program. Retry never manufactures proof. Rollback preserves the XAOA-001 evidence record.

Maintenance: reconcile canonical evidence before publication. Keep the validator deterministic and the public receipt free of credentials and raw workflow logs.
